Houston, TX 77058

Background

The CEV Aeroscience Project (CAP) aerothermodynamics team provide aerothermodynamic environments for ascent abort and reentry using high fidelity computation, ground testing and flight testing

- At the start of the project, the intention was to rely heavily on computational methods, however wind tunnel testing and engineering methods have been used heavily in the construction of the database
- The database is versatile to cover a wide range of trajectories and to an extent, changes in geometry

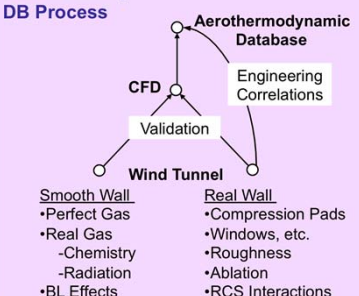

Background

Re-entry Aerothermodynamic Environments

Environment is simulated in ground test facilities by designing tests to investigate specific phenomenon

Aerothermodynamic DB Process

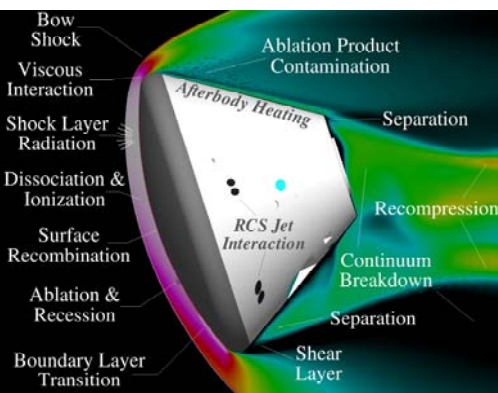

Smooth Wall

- Perfect Gas
- Real Gas
- Chemistry
- Radiation
- BL Effects

Real Wall

- Compression Pads
- Windows, etc.
- Roughness
- Ablation
- RCS Interactions

Aerothermodynamics Analysis

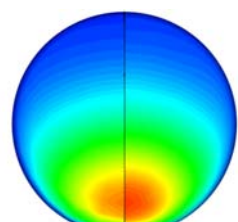

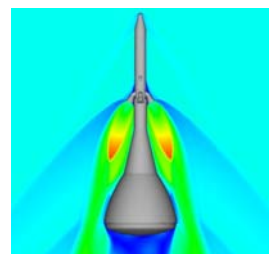

CM Smooth Backshell Heating
Computational Fluid Dynamics

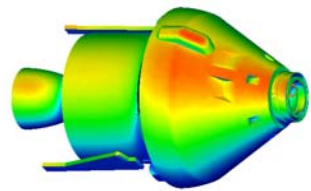

CM Smooth Heatshield Heating
Computational Fluid Dynamics

Smooth Body Radiative Heating

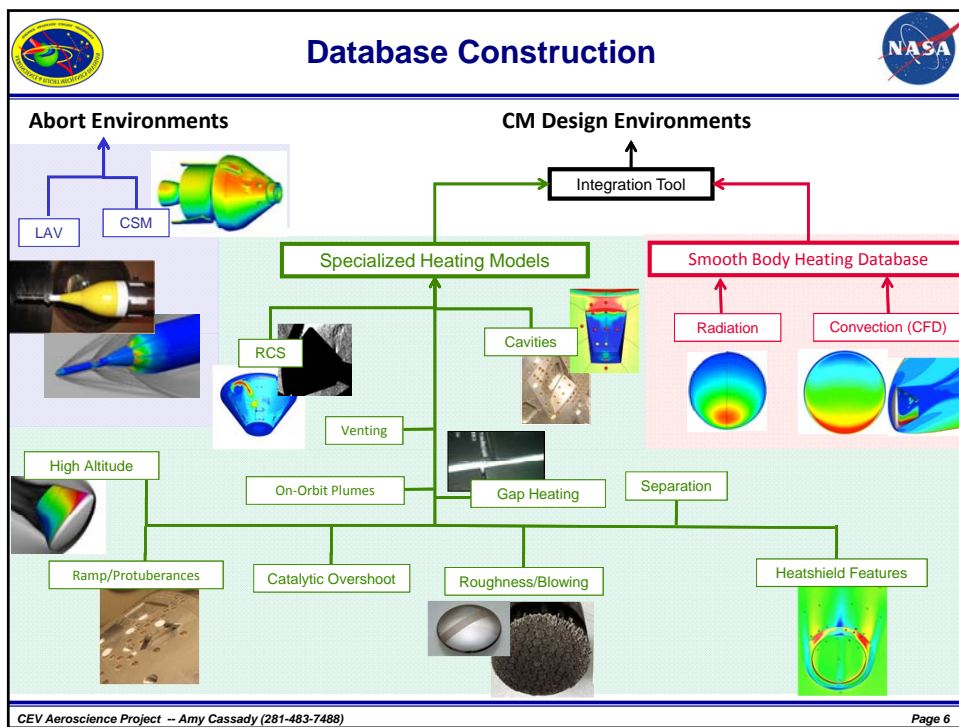

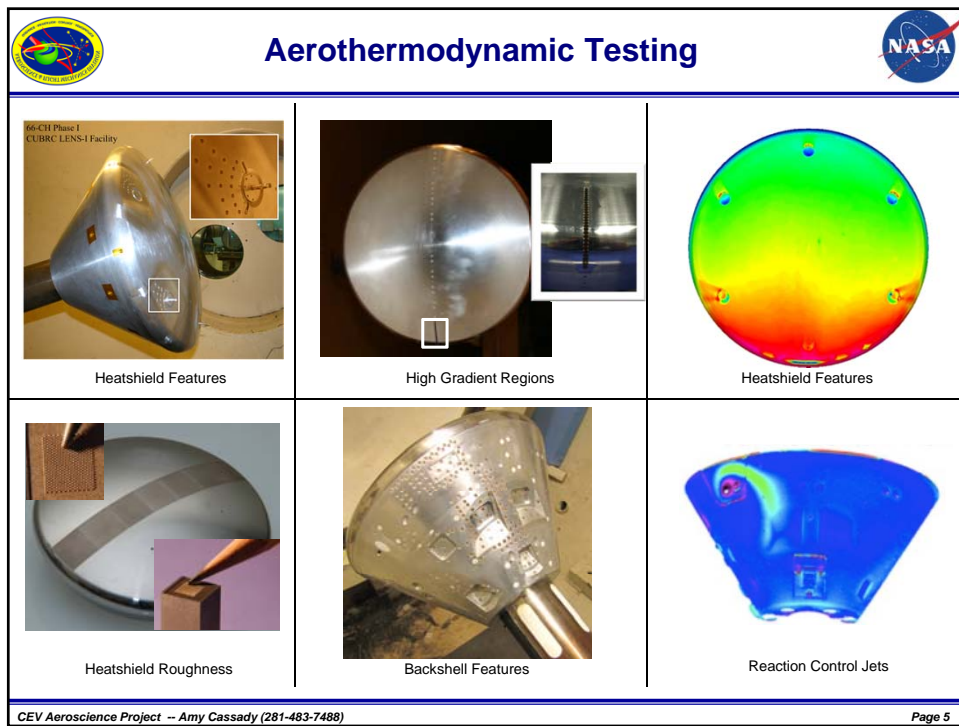

LAV Computational Fluid Dynamics

CSM Ascent Abort Direct Simulation
Monte Carlo

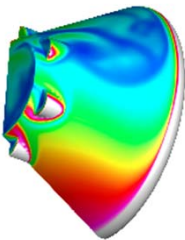

CEV Aeroscience Project -- Amy Cassady (281-483-7488) Page 4

	Major Database Components		
Component	Type	Validation Source	
Smooth Body Convective	CFD derived/Engineering	Orbiter, Apollo, Wind Tunnel Testing	
Smooth Body Radiation	High Fidelity	Wind Tunnel Testing, Heritage	
Cavity Heating	Empirical/Engineering	Orbiter heritage, Wind Tunnel Testing	
RCS Heating	Empirical/RGD- DSMC/Empirical	Apollo, Wind Tunnel Testing	
Venting	Engineering	Heritage	
High Altitude	RGD-DSMC	Heritage	
Gap Heating	Empirical	Orbiter	
Ramps/Protuberances	Empirical/Engineering	Heritage, Wind Tunnel Testing	
Catalytic Overshoot	CFD derived	Orbiter data	
Roughness/Blowing	Empirical/Engineering	Wind Tunnel Testing	
Heatshield Features	CFD/Empirical	Wind Tunnel Testing	
Separation Line	CFD derived	Wind Tunnel Testing

	Lessons Learned		
	<p>Integration with trajectory design is critical – environment indicators included in trajectory design help guide vehicle assessment</p> <p>Integration with the Thermal Protection System design and assessment is critical</p> <ul style="list-style-type: none"> • TPS design and environment derivation are coupled for ablative material • Know how the aerothermodynamic environments are being used • Understand a design environment versus a realistic environment and when to use both <p>Be an active participant in vehicle trade studies or designs like this will come to fruition</p>

Page 8

Lessons Learned

Protuberances, penetrations, gaps, local chemistry, control jets, roughness...all effect the system, do not underestimate their contributions to the total heat load and peak heat rate

CEV Aerospence Project -- Amy Cassady (281-483-7488)

Page 9

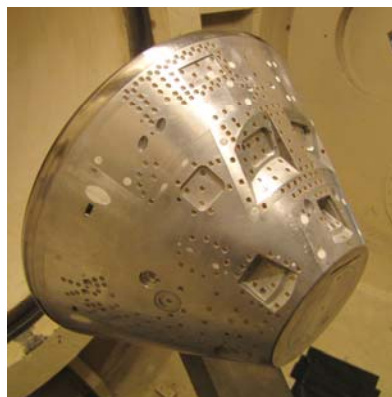

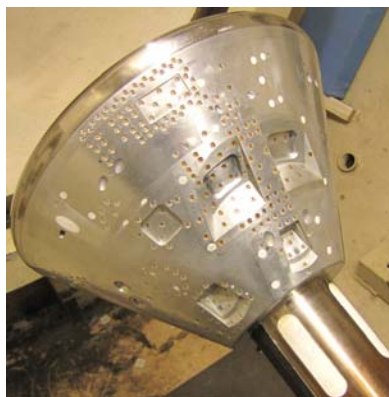

Lessons Learned

CFD has a place in trade studies, predicting environments for smooth bodies and ground to flight traceability, but it isn't ready for non-smooth component analysis or highly unsteady wake flow

- Keystone wind tunnel test with more than 400 discrete measurements on the capsule backshell to understand penetrations/protrusions/RCS environments
